## 98% Savings on Oil Use in Pickle Line

---

Greer Steel's recently installed Oiler sets a new mark of 98% savings on the efficiency of Terronics' Electrostatic Equipment. Normally when we replace a non-electrostatic Oiler, savings over 90 percent is expected, taking oil levels down to 10 percent of previously used. We even replaced a competitor's electrostatic Oiler and our customer found an 80 percent savings, while for the first time, achieving no rust claims.

Of course, you can not save 100 percent of the Oil and presume you will achieve protection of the highly active surface of the freshly pickled steel. But taking Oiling levels down to 2 percent of previous is a new "high water" mark for Terronics. Clearly, if the reduction was "just" down to 10 percent, you would be using 5 times as much or 4 times more than needed.
